9 (a)	An unbiased estimate for the population variance : $s^2 = \frac{n}{n-1}(4^2) = \frac{16n}{n-1} \text{ minutes}^2$	
(b) (i)	Let μ be the population mean time taken for a 17-year-old student to complete a 5 km run. To test at 10 % significance level, $H_0 : \mu = 30.0 \text{ min}$ $H_1 : \mu \neq 30.0 \text{ min}$ For $n = 40$, $s^2 = \frac{16(40)}{39} = \frac{640}{39}$ Test Statistic: Under H_0 , $\bar{T} \sim N\left(30.0, \frac{640/39}{40}\right)$ approximately by Central Limit Theorem since n is large $p\text{-value} = 2P(\bar{T} \leq 28.9) = 0.0859 \leq 0.10$, we reject H_0 and conclude that there is sufficient evidence at the 10 % significance level that the population mean time taken has changed.	
(ii)	The p -value is the probability of obtaining a sample mean at least as extreme as the given sample, assuming that the population mean time taken has not changed from 30.0 min. OR The p -value is the smallest significance level to conclude that the population mean time has changed from 30.0 min.	
(iii)	Since the sample size of 40 is large, by Central Limit Theorem, \bar{T} follows a normal distribution approximately. Thus no assumptions are needed.	
(c) (i)	New population mean timing = $0.95 \times 30 = 28.5 \text{ min}$ To test at 5 % significance level, $H_0 : \mu = 28.5 \text{ min}$ $H_1 : \mu > 28.5 \text{ min}$	
(ii)	Assumption: n is large for Central Limit Theorem to apply. Test Statistic: Under H_0 , $\bar{T} \sim N\left(28.5, \frac{4.0^2}{n-1}\right)$ approximately by Central Limit Theorem
